

## COMMENTARY TO HABILITATION THESIS<sup>1</sup>

The orofacial region is complicated not only from the perspective of embryonal development, but also later throughout the individual's life due to a large number of anatomical structures. Isolated primary or isolated clinical research can, in such a complicated region, bring only partial success and for complex progress in the field, joining forces of these two branches of research is of utmost importance. Here, we illustrate the significance of such linkage on three examples of research projects performed in cooperation of the Czech Academy of Sciences as an institution of primary research and the University Hospital Ostrava as a clinical department. The first part is devoted to odontogenesis and its possible influence on the formation of odontogenic tumours. The second one exhibits the possible usage of an animal biomodel for jaw joint research, and the last part focuses on retromarginal orbital fractures.
